The National Science Foundation (NSF) supports fundamental, curiosity-driven science that enables researchers to advance groundbreaking discoveries. NSF investments are essential to probe scientific frontiers, improve health, and strengthen the nation’s economy. We urge Congress to support at least $8 billion for NSF in fiscal year 2018.

Health and Discovery
NSF provides the vital foundation for the nation’s science and technology portfolio.
- NSF-funded research in fields such as chemistry, physics, and computer science lays the foundation for advances in neuroscience.
- Basic research also enables the pursuit of treatments to prevent and delay debilitating illnesses and improve preventive and public health practices worldwide.

Economic Growth and Prosperity
Federal investments in NSF secure economic benefits for generations to come.
- Economists agree that about 50 percent of the country’s economic growth can be traced to investments in research and development.¹
- One dollar of research money from NSF generates approximately $2 in economic output.²
- Scientific discovery leads to new business. There were 671 university research spin-off companies formed in 2011.³

The Future of the Scientific Enterprise
No one knows what breakthroughs will go undiscovered if NSF funding is not maintained.
- NSF is the funding source for approximately 24 percent of all federally supported basic research conducted by America’s colleges and universities.
- NSF drives innovation by investing in high-risk, cutting edge science and engineering at the frontiers of knowledge.
- Private industry alone can’t support these programs—even as public funding for research and development has stagnated over the past 10 years, industry investment has dropped.⁴
- Scientists are able to build on foundations laid by others because the results of publicly funded research are open to the public.
- Through graduate fellowships, research funding, and the Math and Science Partnership program, NSF trains the next generation of America’s scientists. Since 1952, NSF has awarded more than 50,000 Graduate Research Fellowships.⁸
- The scientific enterprise depends on consistent funding to support America’s scientific workforce. If the scientific pipeline is disrupted, there will be enduring long-term consequences as our talented researchers move on to other fields.
