The National Institutes of Health (NIH) is vital to improving health, strengthening the economy, and investigating scientific frontiers. The $45 billion provided to NIH FY 2022 provided the agency with a 45 percent increase over the past 7 years. To continue building on the progress made possible by this increase, we urge Congress to appropriate at least $49 billion in FY 2023 to NIH, supplemented by the release of the full funds allocated in the 21st Century Cures Act.

Health and Discovery
NIH-supported research drives discovery that transforms medicine, improves treatments, and will one day lead to cures.

- NIH-funded basic (also called fundamental) science is unlocking mysteries with brain-related disorders. Today’s discoveries in the lab will pave the way for tomorrow’s treatments.
- More than 1,000 neurological and neurodegenerative diseases, such as schizophrenia, TBI, autism, and Parkinson’s disease, affect the lives of the nearly 100 million Americans.
- In the last five years of life, total healthcare spending for people with dementia was 57% percent greater than costs associated with death from other diseases, including cancer and heart disease.

Economic Growth and Prosperity
NIH funding is an investment in our country’s future and will reduce healthcare costs, support quality jobs, and increase economic activity.

- Neurological illnesses and mental disorders cost the U.S. more than $760 billion a year. The only way to decrease these costs is to improve prevention strategies and treatments.
- Every dollar of research money from the NIH generates approximately $2.21 in economic output.
- Eighty-five percent of NIH’s budget funds research located in every state, and it fuels almost 400,000 jobs and $69 billion in economic output nationwide.

The Future of the Scientific Enterprise
Many of today’s discoveries were unimaginable less than a decade ago and any budget cuts would threaten sustained progress. Without a continued commitment to research, who knows what medical advances will go undiscovered.

- The substantial lag time between discovery and profitability impacts business. Businesses need NIH research to explore fundamental science before they can translate these critical discoveries into applicable treatments.
- Without a strong workforce, we are jeopardizing the future of U.S. competitiveness. Young scientists are moving from research to other careers due to stagnant funding.
- The 2021 Global R&D Funding Forecast projected total R&D investments in the U.S. from 2020, for the first time, would be surpassed by China by over $20 billion. The gap between China and U.S. R&D investment is expected to widen over the next several years.
